

Figure 1 is a line graph showing the probability of infection (P) over time (days) for four scenarios. The y-axis represents P, ranging from 0.00 to 1.00. The x-axis represents Time (days), ranging from 0 to 4000. The legend indicates four scenarios: OS:no CPG P/LP (orange solid line with '+' markers), OS:CPG P/LP (blue solid line with '+' markers), EFS:no CPG P/LP (orange dashed line with '+' markers), and EFS:CPG P/LP (blue dashed line with '+' markers). The graph shows that the probability of infection decreases over time for all scenarios except OS:CPG P/LP, which remains at 1.00. The EFS:CPG P/LP scenario shows a sharp drop in P around day 1500, while the other scenarios show a more gradual decline. Text in the plot area indicates OS P = 0.32 and EFS P = 0.7.

	0	500	1000	1500	2000	2500	3000	3500	4000
OS:no CPG P/LP	16	13	13	12	9	9	7	7	5
OS:CPG P/LP	6	5	5	4	3	2	2	2	2
EFS:no CPG P/LP	16	12	10	9	4	3	3	2	1
EFS:CPG P/LP	6	4	3	3	2	1	1	1	1
